

— THE BRIDGE DEMO DAY 15 JULY 2026

PROTOCOL 01

The private payments layer for Solana.

Shield, send, subscribe. Post-quantum by design. Live on devnet.

#2 worldwide · Dev3pack Global Hackathon

Live on devnet · v1.0.3

Built solo in under 6 months

— 01 PROBLEM

Every payment on Solana is **public**.

Salaries, invoices, subscriptions, treasury moves. Readable by anyone, forever.

PAY A CONTRACTOR

Their entire income history becomes public the moment you send. So does yours.

SUBSCRIBE TO A SERVICE

Your subscriptions, habits and balance are one address lookup away for any scraper.

RUN A BUSINESS ON-CHAIN

Competitors read your revenue, your customer list and your margins, live.

This is the real blocker for on-chain payments. Businesses do not move payment volume onto a rail where every customer and every margin is public. Not speed. Not fees. Exposure.

One rail. Two modes.

Every payment flow, P2P transfers, subscriptions and merchant checkout, exists in both modes on the same rail.

CLASSIC MODE

Transparent, fast, cheap. Normal Solana. Nothing to learn, nothing to migrate.

PRIVATE MODE

Shielded and unlinkable, one tap. Proofs are generated on the user's phone. Nothing personal ever leaves the device.

WHAT THE SUBSCRIBER GAINS

Identity, balance and payment history stay theirs. Subscribe to anything without broadcasting it to the chain.

WHAT THE MERCHANT GAINS

Clean, final settlement with no chargebacks, and a subscriber who stays. Subscriptions acquire the merchant. Private balances retain the customer.

Not a deck concept. It runs today.

ANDROID APP

Release-signed APK. On-device proving, biometric unlock, full wallet.

CHROME EXTENSION

MV3 extension mirroring the wallet, with phone pairing by QR.

MERCHANT SDK

@protocol-01 packages on npm. Subscriptions, checkout and license keys in a few lines.

MUGEN EXCHANGE

P2P fiat on-ramp with on-chain escrow, built on the same stack. Live web app.

STEP 01

Shield. Pick a denomination, the phone generates the proof, the note enters your private vault.

STEP 02

Subscribe or send. One tap. The chain sees a valid proof, not who you are or what you hold.

STEP 03

Unshield anytime. Convert back to public SOL at any address you choose.

A private subscription takes about 30 seconds end to end. 4 demo merchants attested on-chain for the flow (Netflix, Spotify, YouTube, Disney+ demos).

Post-quantum plumbing. Boring on purpose.

ZK-STARKS ON DEVICE

Hash-based proofs with **no trusted setup**, generated on the phone. No ceremony, no toxic waste, no proving server reading your data.

NATIVE ON-CHAIN VERIFIER

A custom multi-circuit FRI verifier deployed on Solana checks proofs in **under 1.4M CU**.

POST-QUANTUM ADDRESSES

Stealth addresses combine X25519 with **ML-KEM-768** (NIST PQC), plus a WOTS+ hash-based vault as an Ed25519 hedge.

RELAYER NETWORK

An on-chain relayer program with multi-relayer failover submits transactions, **breaking transaction-graph links**.

The fee rail **is** the business.

PROTOCOL FEE

Every private settlement pays an automatic on-chain fee of **0.3 to 0.5%**. One fee rail across P2P, subscriptions and checkout. Collected at settlement by the program, no invoicing, no leakage.

MERCHANT SDK TIERS

Standard and ZK license tiers with **anonymous license keys, already live**. Merchants integrate in days and never touch customer PII.

THE WEDGE

Subscriptions acquire merchants.

Recurring revenue is why they integrate. Private balances are why their subscribers stay.

Pre-revenue today, metered from day one. The fee logic is already deployed in the programs. Revenue switches on with mainnet, not with a business-model pivot.

Payments moved on-chain. Privacy did not.

STABLECOINS WON

Stablecoins settle **trillions per year** and card networks are integrating them. Payments are the first crypto use case with real volume, and Solana is where they settle cheapest.

SOLANA VALIDATED THE NEED

Solana shipped native Subscriptions and Allowances plus Confidential Transfers on mainnet in June 2026. **Recurring is native now, amounts can be hidden, but who pays whom stays public.** The ecosystem confirmed demand and left the hard part open.

THE QUANTUM CLOCK IS SET

NIST guidance deprecates today's elliptic-curve crypto by 2030 to 2035. Everything public now can be harvested and read later. **A payment rail built in 2026 should not expire in 2030.**

Subscriptions went native in June. They are still public.

CAPABILITY	PROTOCOL 01	SOLANA NATIVE (SUBS + CONFIDENTIAL TRANSFERS)	TRANSFER MIXERS (UMBRA CLASS)	ELUSIV
Hides amounts	Yes	Yes, Token-2022	Fixed denominations	Shut down 2024
Recurring billing	Yes, native	Yes, since June 2026	No, transfers only	n/a
Hides the payment graph	Yes	No, delegation links payer to merchant	Yes	n/a
Private subscriptions	Yes, the combination	No, relationship public	No	n/a
Mobile app, on-device proving	Yes	No	App in beta; encrypted state needs the MPC cluster	n/a
Post-quantum design	Yes, hash-based	No	No	n/a
Status	Devnet, audit gates mainnet	Mainnet, audited	Mainnet	Dead

Arcium is an encrypted-compute layer, complementary rather than competing; Protocol 01 already ships an Arcium bridge program for multi-leg flows.

Mainnet is gated on an external audit. **By design.**

Payments infrastructure ships audited first and capped at launch, or it should not ship.

NOW · SHIPPED

- **v1.0.3 live on devnet** across mobile, extension and web
- Internal security audits ran, real findings, **fixes shipped and validated on device**
- Full trail public in the repo

NEXT · H2 2026

- **External security review**, the mainnet gate
- Mainnet launch with **per-pool caps**
- First pilot merchants through the SDK

THEN · 2027

- **Full post-quantum end to end**
- Fiat on-ramp integration via Mugen
- Payment-processor and wallet partnerships

One founder. The whole stack.

SOLO DEV

Ramy "Slashy" Chatbi

FOUNDER & SOLO DEVELOPER

24 years old, Paris. Epitech MSc Cybersecurity. Previously Thales and CaptNBoat. 7+ years of code.

IsSlashy

@Slashy_fx

protocol-01.dev

Since January 18, 2026, one person designed, built and deployed 15 Solana programs, 12 ZK circuits, 13 SDKs, 3 client apps, a relayer network and a P2P exchange. **No team, no funding, just execution.**

- 2019 Self-taught developer at 17.
- 2023 Bachelor at Epitech Paris. Dev and PM at CaptNBoat, led cybersecurity initiatives.
- 2025 MSc Cybersecurity, Epitech. Went independent, Solana hackathons full time.
- JAN 2026 Protocol 01, day one of the solo build.
- JUL 2026 The Bridge Demo Day. Day 178 of the build.

Looking for a commercial cofounder. French entity registered (Volta). The Bridge is where I want to find the other half of this company.

The protocol is built. Help me sell it.

ACCELERATOR SEAT

GTM coaching. Distribution is my gap. The tech is not. I need reps on positioning, pricing and merchant sales.

INTRODUCTIONS

First design partners: Solana merchants, wallets and payment processors. Plus a path to fund the external audit that unlocks mainnet.

PRE-SEED READINESS

Zero raised, clean table. Entity live in France. Ready to convert accelerator coaching into a fundable seed story.

Protocol 01 ranked #2 worldwide in your hackathon. Give it the commercial engine, and Solana gets the private payments rail it is missing.

protocol-01.dev amirramy.chatbi@gmail.com [@Slashy_fx](https://twitter.com/Slashy_fx) · [@Protocol01_](https://twitter.com/Protocol01) github.com/IsSlashy/Protocol-01

Likely questions, short answers.

DON'T NATIVE SUBSCRIPTIONS AND ALLOWANCES SOLVE THIS?

They make recurring billing native, and Token-2022 can hide amounts. The delegation account still publicly links payer to merchant, forever. We hide the relationship itself, plus identity and balance.

WHY IS MAINNET NOT LIVE?

An external audit gates it, deliberately. Internal audits found real issues; fixes are shipped, validated on device and public. Funding the audit is part of this ask.

COMPLIANCE POSTURE?

Merchants receive clean, attributable settlement; it is the user's graph that is protected. ZK innocence-proof selective disclosure is prototyped and on the roadmap.

REVENUE TODAY?

Zero. The 0.3 to 0.5% fee rail is already deployed in the programs, so monetization switches on with mainnet, not with a pivot.

WHY POST-QUANTUM NOW?

Public data is harvested today and decrypted later. Hash-based proofs cost users nothing extra now and remove the migration cliff later.

SOLO-FOUNDER RISK?

Acknowledged and priced in: public repo, CI, tests, documented architecture, and an explicit cofounder search through this program.
